Project Title: Issuance of a Standardized Permit to Advanced Environmental Inc., Fontana to authorize the storage and transfer of used oil, waste oil, non-RCRA oily waste water, used antifreeze, and oily solids.

State Clearinghouse Number: \_\_\_\_\_

Contact Person: Ms. Rosemary Domino Phone # (909) 356-9025

Project Location (*Include County*):

Advanced Environmental Inc. is located at 13579 Whittram Ave., Fontana (San Bernardino)

Project Description: DTSC is considering the approval of a Series B Standardized Permit for the Advanced Environmental, Inc. (AEI) facility. If the permit is approved, AEI will be authorized to continue to operate a hazardous waste storage and transfer facility (Facility) to collect, bulk store, and transfer waste used oil, oily wastes, waste antifreeze, oil contaminated solid waste and oily water from offsite generators. The permit would also authorize AEI to construct a new tank farm that will increase the maximum existing storage capacity by 12 percent. The new tank farm will replace existing tank farms and consolidate tanks into one central area. The existing tank farms will be closed as a condition of this Standardized Permit. No recycling or treatment of any waste is allowed under this Permit. All waste must be shipped offsite to an authorized waste transfer, treatment, storage, or disposal facilities.

Findings of Significant Effect on Environment:  
(*A copy of the Initial Study which supports this finding should be attached.*)

This project will not have any significant cumulative effects because (1) the Facility is in an industrial area and the activities at the site are consistent with other land uses; (2) this project will not result in air contamination because of the low volatility of waste oil, wastewaters and antifreeze, (3) all storage activities will be conducted within secondary containment areas to contain any potential spillage, and (4) management practices, safe operation procedures, and inspections to help ensure there are no releases. The management of used oil and antifreeze by the Facility actually reduces the potential for impacts on the environment by providing waste management capacity for generators which might otherwise improperly dispose of their used oil and antifreeze.

Mitigation Measures:

No mitigation measures are required.
